

## Biton ASP Example

*One of our customers has the following topology :*

The Biton PMS application is hosted by Biton. Access to it is via the Internet from upto three remote locations - the main office in London, a satellite office in the Channel Islands and the London Office's Disaster Recovery location.

At each of the remote sites no extra hardware or software relating to the Biton PMS application is required - only access to the Internet and a browser installed on each PC.

All users at all sites have real-time access to the system.

### **Advantages to the customer of this solution :**

**Hardware** : No extra hardware needs to be installed at each location, saving space and support overheads

**Support** : Support of the Biton PMS server and application is the responsibility of Biton

**Flexibility** : Extra client PC's can easily be added at any remote sites with no need to install any special client side software. New sites can also easily be added to the topology with no special hardware or software being required to give users complete access to the Biton PMS application.
